

MEOW-WOOF Whitepaper

Release Date: March 3, 2026

Network: Solana Mainnet

Token Standard: SPL Token (Solana Token Program / Tokenkeg)

Website: meow-woof.org

MEOW-WOOF is not the story of a single coin—it's a long-running, sustainable on-chain rivalry. It turns meme emotion into verifiable data, and turns “winning” into a public weekly settlement. You are not just a buyer. You are part of a faction. Holding, trading, and voting all push your side forward.

1. Overview

MEOW-WOOF is a dual-faction rivalry protocol composed of two symmetric SPL tokens: **\$MEOW** and **\$WOOF**. The protocol's core goal is to visualize market behavior and community consensus, and to sustain a repeating game loop through a fixed weekly cadence.

- One round lasts 7 days (a “Round”).
- During each round, public market data is continuously sampled to compute five battle attributes.
- Every Sunday at 13:00 UTC, the protocol settles the weekly winner and opens governance voting for the winning faction.
- The winning faction votes on how to handle that week's unlocked War Chest tokens (burn-first, reserve-second).

2. Core Principles

2.1 The more “standard” the on-chain pieces are, the stronger the trust

Both MEOW and WOOF are issued and transferred using Solana's official Token Program to avoid concerns about “unknown backdoors” from custom mint contracts. The tokens have no tax (0%), no transfer restrictions, and no hidden permissions.

2.2 Permanent renouncement of authorities

After minting is complete, both tokens permanently remove:

- Mint Authority (no further minting).
- Freeze Authority (no freezing).

Anyone can verify authority status on third-party explorers such as Solscan.

2.3 Transparent vesting, verifiable on-chain

War Chest and Team allocations are vested via Streamflow and are publicly verifiable. Liquidity is permanently secured via LP burn to eliminate rug risk.

3. Token Info & Branding

Master brand: **MEOW-WOOF**

3.1 \$MEOW

Name: MEOW-WOOF (MEOW)

Symbol: MEOW

Description: Cat faction currency for the MEOW vs WOOF war on Solana. Win votes, burn supply, claim glory.

3.2 \$WOOF

Name: MEOW-WOOF (WOOF)

Symbol: WOOF

Description: Dog faction currency for the MEOW vs WOOF war on Solana. Hold power, stack reserves, strike back.

4. Tokenomics

The two tokens are fully symmetric with identical rules.

- Total Supply: 5,000,000,000.
- Decimals: 9.

4.1 Initial Allocation

- 70% (3.5B): Initial Liquidity (LP).
- 20% (1.0B): War Chest.
- 10% (0.5B): Team.

4.2 Permanent LP Burn

After the initial liquidity pool is created, the LP tokens are sent to an unrecoverable address, permanently locking liquidity.

Why burn LP? Because it proves the base liquidity cannot be withdrawn by the team, eliminating the primary rug-pull vector at the root.

Note: Burning LP does not prevent a future centralized exchange (CEX) listing. CEX listings typically require separate market-making resources or services; the ability to withdraw on-chain LP is not a strict requirement.

5. War Chest & Team Vesting

5.1 War Chest (1.0B per side)

War Chest is vested via Streamflow and unlocks weekly.

Schedule:

- Start: effective from the season beginning the week of March 8, 2026.
- Frequency: weekly.
- Amount: 10,000,000 tokens per side per week.

Estimated duration:

- Total War Chest: 1,000,000,000 tokens.
- Weekly unlock: 10,000,000 tokens.
- Estimated length: 100 weeks.
- Unlocking stops automatically once fully released (no further unlocks).

Unlocked War Chest tokens are sent to a predefined recipient account, and the winning faction's governance vote decides that week's handling (default: burn-first, reserve-second).

5.2 Team (0.5B per side)

Team tokens are vested via Streamflow with a cliff and linear release.

Schedule:

- Cliff: 6 months, unlocking begins on September 3, 2026.
- Linear: then released linearly over the following 12 months.

6. Cadence & Timeline

6.1 Genesis Epoch

Time: March 3, 2026 – March 8, 2026

Goal: launch and stabilize operations, onboard the community, begin data accumulation, and transition the UI/off-chain systems into normal mode.

During Genesis:

- Website and dashboard are fully open.
- Data sampling and the five-attribute panel run normally.
- War Chest does not enter the “formal season governance loop” until Season 1 starts on March 8.

6.2 Season 1

Starting the week of March 8, 2026, the weekly loop begins:

- Hourly sampling and accumulation.
- Weekly settlement every Sunday at 13:00 UTC.
- Post-settlement governance vote for the winner (HONOR / BALANCE / RESERVE).

7. Battle Mechanics

7.1 Five Battle Attributes

MEOW-WOOF models weekly market/community behavior through five dimensions:

- STR (Strength): trading volume intensity.
- DEF (Defense): liquidity depth.
- DEX (Dexterity): transaction activity.
- CHR (Charisma): buy-side intensity and new interest.
- LUCK (Luck): controlled small randomness to add drama without changing long-run trends.

All attributes are displayed as a “tug-of-war bar”. For each attribute, $\text{MEOW\%} + \text{WOOF\%} = 100\%$.

7.2 Sampling & Weekly Averaging

The system samples public data hourly, computes tug-of-war percentages for that hour, and writes them into the round’s accumulation bucket. At the end of the week, the protocol averages roughly 168 hourly samples to determine the final weekly values. This reduces last-second manipulation and dampens short-lived spikes.

Sampling failure handling (important):

- If an hourly sample fails, that hour is skipped and a missing counter is recorded.
- Weekly averages are computed from the successfully sampled hours only.
- The settlement announcement will disclose the sample coverage (e.g., 166/168).

7.3 Attribute Formulas

Notation:

- X_M = raw metric value for MEOW.
- X_W = raw metric value for WOOF.

Unified tug-of-war formula:

- $\text{Score_M} = \text{round}(X_M / (X_M + X_W) * 100)$.
- $\text{Score_W} = 100 - \text{Score_M}$.
- If $(X_M + X_W) = 0$, then $\text{Score_M} = 50$ and $\text{Score_W} = 50$.

7.3.1 STR (Strength — Volume)

Source: 24h Volume

$X = \text{Volume}_{24}$

7.3.2 DEF (Defense — Liquidity)

Source: Liquidity USD

$X = \text{Liquidity}_{\text{USD}}$

7.3.3 DEX (Dexterity — Activity)

Source: 24h Txns (buys + sells)

$X = \text{Txns}_{24}$

7.3.4 CHR (Charisma — Buy-side intensity)

Source: 24h Buys

$X = \text{Buys}_{24}$

Note: CHR uses buy count as an intuitive proxy for “new interest.” It is not a holder snapshot; it is a market-side growth signal.

7.3.5 LUCK (Luck — controlled randomness)

LUCK is designed to feel natural and continuous—like “battle winds”—without becoming decisive on its own. LUCK is generated hourly and included via its weekly average alongside the other four attributes.

7.4 Weekly Winner Determination

Final weekly results are the weekly averages of the tug-of-war percentages: STR_M, DEF_M, DEX_M, CHR_M, LUCK_M.

MEOW total score:

- $\text{Total_M} = (\text{STR_M} + \text{DEF_M} + \text{DEX_M} + \text{CHR_M} + \text{LUCK_M}) / 5.$

Winner rules:

- If $\text{Total_M} > 50$, MEOW wins.
- If $\text{Total_M} < 50$, WOOF wins.
- If an effective tie occurs, LUCK breaks the tie (higher LUCK wins).

Effective tie definition:

- If Total_M , rounded to 1 decimal place, equals 50.0, it is treated as a tie and LUCK is used.

This guarantees “what you see is what you get”: the tug-of-war bars are the basis of the final result.

8. Governance & Burn Mechanism

8.1 Hold-to-Vote

Voting power is capital-weighted: 1 Token = 1 Vote.

Eligibility uses real-time balance checks: when a user votes, the system reads the token balance of the voting address on-chain and uses it as vote weight.

This allows “flash voting”: users may buy before voting and sell after voting. The project accepts this behavior early on because it drives liquidity and activity. As the protocol scales, it reserves the right to upgrade governance (snapshots, minimum holding periods, vote-period locking, etc.).

8.2 Three Choices: HONOR / BALANCE / RESERVE

After settlement, the winning faction votes to decide how to handle the weekly unlocked War Chest tokens.

The protocol computes a base burn rate BaseBurn (percentage) from the margin:

- $\text{Margin} = \text{abs}(\text{Total_M} - 50)$.
- $\text{BaseBurn} = \text{clamp}(60 + \text{Margin} * 0.6, 60, 90)$.

Then three options are offered (important: +10 / -10 means adding/subtracting 10 percentage points from the burn rate percentage value):

- HONOR: $\text{Burn} = \text{BaseBurn} + 10$.
- BALANCE: $\text{Burn} = \text{BaseBurn}$.
- RESERVE: $\text{Burn} = \text{BaseBurn} - 10$.
- Example: if $\text{BaseBurn} = 72$, then HONOR = 82, BALANCE = 72, RESERVE = 62.

Semantics: HONOR emphasizes stronger deflation and a short-term scarcity narrative; BALANCE is neutral; RESERVE preserves more “ammo” for future ops, market-making, listings, etc.

After voting ends, the team executes the chosen on-chain actions and publishes verifiable transaction records.

9. Architecture (On-chain + Off-chain)

9.1 On-chain Components

- Two SPL tokens (MEOW, WOOF).
- Streamflow vesting contracts (War Chest, Team).
- DEX liquidity pools and permanent LP burn.

9.2 Off-chain Components

- Data sampling & settlement: Cloudflare Workers (hourly sampling, weekly settlement).
- State storage: Cloudflare KV (battle state, weekly accumulation, world map state).

- Voting storage: Cloudflare D1 (vote details and tally summaries).
- Frontend: public website dashboard and visualization map.

9.3 Data Sources & Verifiability

Battle data is derived from public market aggregator data and verifiable on-chain state. The protocol does not rely on private databases to decide winners. Rules are fixed, data is public, and calculations are reproducible.

10. Risk Disclosure

- Meme assets are highly volatile and may drop to zero.
- Market metrics can be manipulated short-term. Hourly sampling + weekly averaging reduces single-point impact but cannot guarantee immunity.
- Real-time balance voting allows flash behavior; it is accepted early for liquidity/activity, with upgrade paths for stricter governance later.
- On-chain execution may be affected by congestion, RPC instability, or transaction failure. The project will publish outcomes based on verifiable transactions.

11. Closing

MEOW-WOOF is a long-running rivalry protocol. It does not promise “get rich.” It offers something more real: turn consensus into battle, battle into rules, and rules into habit.

Don't just hold. **Fight.**

Appendix A: Mainnet On-chain Information

A1. Mint Addresses

- MEOW Mint: CAign7KRPN5xSxHALXiYJBPfyaGurmXg7hMST7snixFH
- WOOF Mint: 9aZjzzYXv4pqwdJLSxJwAaMS8dhSMV2bWkL71SKbu9U6

A2. Streamflow War Chest Vesting

- MEOW War Chest Contract: 51zie9oHdgM2jUtxsRNxMYrQCLXZs5mm5CmqXHrBhyWi
- Proof: <https://app.streamflow.finance/contract/solana/mainnet/51zie9oHdgM2jUtxsRNxMYrQCLXZs5mm5CmqXHrBhyWi>
- WOOF War Chest Contract: 9WX9frGJZBnxVFgMg7WZeFgojBLAtpbZmCwqyw88bUE9
- Proof: <https://app.streamflow.finance/contract/solana/mainnet/9WX9frGJZBnxVFgMg7WZeFgojBLAtpbZmCwqyw88bUE9>

A3. Streamflow Team Vesting

- MEOW Team Contract: EEoV3yTFgU1oEq5mVG4K1GgLMeFPMG4fhA14YNKHFrUb
- Proof: <https://app.streamflow.finance/contract/solana/mainnet/EEoV3yTFgU1oEq5mVG4K1GgLMeFPMG4fhA14YNKHFrUb>
- WOOF Team Contract: 7N7J9FKrqirWcs6SmyW79SSQWYPKMxLFECWhKJKxSdbf
- Proof: <https://app.streamflow.finance/contract/solana/mainnet/7N7J9FKrqirWcs6SmyW79SSQWYPKMxLFECWhKJKxSdbf>

A4. LP & Permanent Burn Proof

- MEOW LP Pool Address: TBD
- WOOF LP Pool Address: TBD
- LP Burn Transaction Hash: TBD (fill in after pool creation)

Appendix B: Battle & Governance Summary

- Weekly rounds (Round).
- Hourly sampling; settlement every Sunday at 13:00 UTC.
- Five tug-of-war attributes: STR / DEF / DEX / CHR / LUCK (sum to 100%).
- Winner: average of five weekly averages; >50 wins.
- Winner opens vote to decide War Chest unlocked token burn rate.
- Three options: HONOR (higher burn) / BALANCE (base) / RESERVE (lower burn).

- LP permanently burned; War/Team Streamflow vesting publicly verifiable.
- No minting, no freezing, 0% tax.
